1.0 INTRODUCTION AND BACKGROUND

Tranplan Associates ("Tranplan") is pleased to present the results of a traffic impact study dealing with the proposed Naomi Park Residences development on the south side of Southview Drive west of in the City of Greater Sudbury (see **Exhibit 1.1** *Artist's Rendering* and **Exhibit 1.2** *Proposed Site Plan*).

The proposed development consists of two apartment buildings with a total of 64 units. Site access is via a driveway from Southview Drive west of Janmar Court.

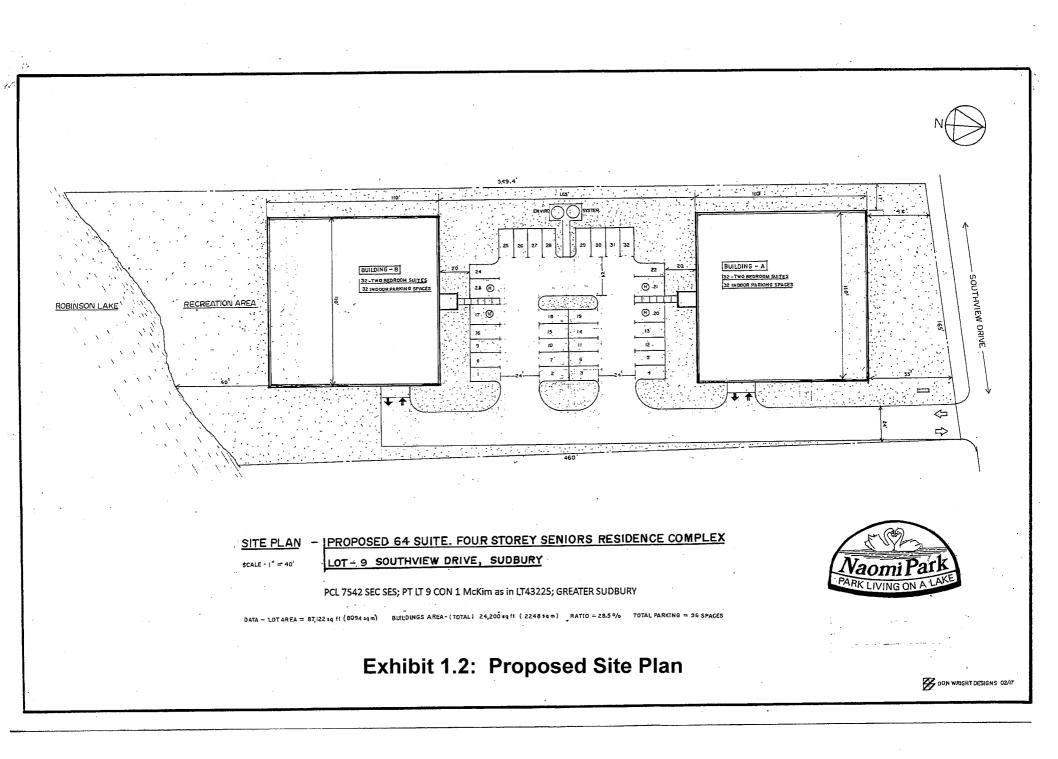

The study has focused on the impact of the proposed development on the intersection of Southview Drive with Kelly Lake Road. A special turning movement traffic count was conducted at the intersection to establish base year conditions.

The study looked at a planning horizon year of 2023 with background traffic volumes increased by 1.5% per annum from 2017 to 2023. New traffic from the proposed development was estimated based on the Institute of Transportation Engineers (ITE) Trip Generation Manual trip rates.

Tranplan was retained by the owners to carry out the traffic study and this report describes the study process and presents the findings. The Principal Findings and Recommendations are presented in the following section.

Exhibit 1.1: Artist's Rendering of Naomi Park Residences

2.0 PRINCIPAL FINDINGS AND RECOMMENDATIONS

- 2.1 The proposed apartment buildings (64 units) are projected to generate 49 vehicle trips (32 in, 17 out) during the afternoon peak hour and 37 vehicle trips (8 in, 29 out) during the morning peak hour. It is estimated that 85% of the site traffic will be oriented towards the east towards Kelly Lake Road with 15% towards the west towards the Highway 17 Bypass (see Exhibit 3.1c). The 85% oriented towards the west are expected to be split between Kelly Lake Road (40% of the 85%) and Southview Drive (60% of the 85%)
- 2.2 The critical movements at the Southview Drive/Kelly Lake Road intersection are the Kelly Lake Road southbound right and left turns which are currently operating at approximately 66% of their capacity during the afternoon peak hour (Level of Service "C" with average delays of 18 seconds see Table 5.1). During the morning peak hour the southbound approach is operating at 39% of its capacity (LOS "B" with average delays of 11 seconds). The eastbound and westbound approaches are at Level of Service "A" during the morning peak and LOS "A" and "B" during the afternoon peak with average delays ranging from nine seconds to 14 seconds.
- 2.3 By 2023, without the proposed development, the Kelly Lake Road southbound approach is expected to be operating at 75% of its capacity during the afternoon peak hour (Level of Service "C" with average delays of 23 seconds see **Table 5.1**). During the morning peak hour the southbound approach is projected to operate at 43% of its capacity (LOS "B" with average delays of 12 seconds). The eastbound and westbound approaches are expected to be at Levels of Service "A", "B" and "C" with average delays ranging from 10 seconds to 16 seconds during the morning and afternoon peak hours.
- 2.4 The addition of the site traffic to the 2023 background traffic has a minor impact

on the Southview Drive/Kelly Lake Road intersection.

- The southbound approach along Kelly Lake Road is expected to experience a small increase in the capacity utilization from 75% to 78% with average delays increasing slightly from 23 seconds to 25 seconds during the afternoon peak hour (see Table 5.1). During the morning peak hour the capacity utilization is expected to increase from 43% to 45% with the average delays increasing slightly from 12.1 seconds to 12.4 seconds per vehicle.
- The eastbound approach would experience an increase in average delay from 10.3 seconds to 10.7 seconds at Level of Service "B" during the afternoon peak hour (from 9.7 seconds to 10.2 seconds during the morning peak hour - see Table 5.1).
- The westbound approach would experience an increase in average delay from 16.4 seconds to 18.2 seconds at Level of Service "C" during the afternoon peak hour (from 10.0 seconds to 10.2 seconds during the morning peak hour - see Table 5.1).
- 2.5 In summary, the proposed development will have a minimal impact on the Southview Drive/Kelly Lake Road intersection and will not bring about the need for any mitigation measures at the intersection.
- 2.6 Traffic signals are not warranted at the Southview Drive/Kelly Lake Road intersection at existing traffic levels, at 2023 background traffic levels or in 2023 with the proposed development (see **Table 5.2**). However, conditions may be close enough over the next five/ten years that the City should plan to carry out regular monitoring of the intersection.
- **2.7** The proposed development will require upgrading of Southview Drive to an urban cross-section with a sidewalk along its frontage.

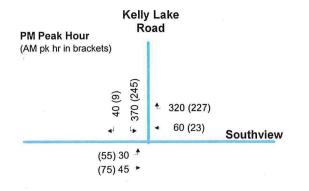

3.0 EXISTING CONDITIONS

- **3.1** Southview Drive in the study area is a two-lane Collector Road with a speed limit of 50 km/h. At the development site, it has a rural cross-section with gravel shoulders and no sidewalks. The traffic volumes along this section of Southview Drive are approximately 2,500 vehicles per day. East of the development site, Southview Drive has an urban cross-section with an eight metre wide pavement plus curb and gutter, and a sidewalk along the south side. East of Kelly Lake Road, Southview Drive carries approximately 10,000 vehicles daily.
- 3.2 Kelly Lake Road is a designated Collector Road with a 50 km/h speed limit. In the immediate area north of Southview Drive it has a nine metre wide pavement with an urban cross-section (curb and gutter) and a sidewalk along the east side. The traffic volumes along this section of Kelly Lake Road are approximately 8,000 vehicles per day.
- **3.3** The existing Southview Drive/Kelly Lake Road intersection is:
 - An All-Way STOP T-intersection with a single lane on all approaches, with traffic calming pavement narrowings enforcing a single lane approach.
 - The Kelly Lake Road southbound approach is currently operating at approximately 66% of its capacity at Level of Service "C" with average delays of 18 seconds during the afternoon peak hour (LOS "B" with average delays of 11 seconds during the morning peak - see **Table 5.1**). The eastbound and westbound approaches are at Level of Service "A" and "B" with average delays of 9 to 14 seconds.
 - Traffic signals are not warranted at the intersection at existing traffic levels (see **Table 5.2**).

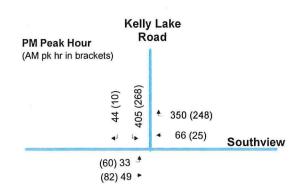

a) Base Year (2017) Traffic Volumes

(see Appendix A for details on the derivation of the 2017 traffic volume estimates).

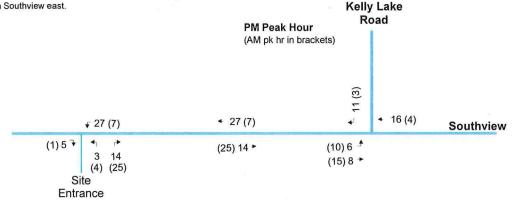

b) 2023 Background Traffic

Assumed growth of 1.5% p.a. from 2017 to 2023.

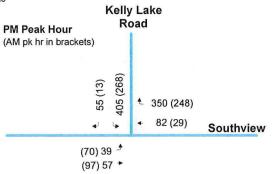

c) Site Traffic

Assumed 15% to/from Bypass; 40% of 85% to/from Kelly Lk Rd, rest to/from Southview east.

d) 2023 Total Traffic

2023 Background Traffic plus Site Traffic

Exhibit 3.1 Existing and Projected Traffic Volumes

4.0 TRAFFIC FORECASTS

- 4.1 The traffic volumes at the Southview Drive/Kelly Lake Road intersection were projected to 2023 by increasing the 2017 volumes by 1.5% per annum (i.e. the 2017 through volumes were increased by 9.34% see Exhibit 3.1b).
- 4.2 The proposed apartments (64 units) are projected to generate 49 vehicle trips (32 in, 17 out) during the afternoon peak hour and 37 vehicle trips (8 in, 29 out) during the morning peak hour (see Table 4.1).
- 4.3 It is estimated that the site traffic orientation will be 85% towards the east towards Kelly Lake Road and 15% towards the west towards Highway 17 (Southwest Bypass). The 85% oriented towards the east are expected to be split between Kelly Lake Road (40% of the 85%) and Southview Drive (60% of the 85%).
- 4.6 Exhibit 3.1d shows the total traffic volumes in 2023 with the site traffic (Exhibit 3.1c) added to the 2023 Background traffic (Exhibit 3.1b).

Note: Numbers may not add up exactly due to rounding.

5.0 ANALYSIS

- **5.1** At the 2023 background traffic levels (without the proposed development), the following conditions are expected:
 - The southbound approach along Kelly Lake Road is expected to operate at Level of Service "B" during the morning peak hour and at LOS "C" during the afternoon peak hour (see **Table 5.1**); during the afternoon the average projected delays are 23 seconds per vehicle (12 seconds during the morning peak hour).
 - The highest projected capacity utilization at the intersection is 0.75 for the southbound approach (see **Table 5.1**).
 - Traffic signals are not warranted at the intersection at the projected 2023 background traffic levels (see Table 5.2).
- 5.2 With the site traffic (Exhibit 3.1c) added to the 2023 background traffic (Exhibit 3.1b) the following conditions are expected:
 - The southbound approach along Kelly Lake Road is expected to continue operating at Level of Service "B" during the morning peak hour with the average delays increased from 12.1 to 12.4 seconds per vehicle; during the afternoon peak hour the average delays are projected to increase from 22.8 seconds to 25.3 seconds per vehicle (see Table 5.1).
 - The highest projected capacity utilization at the intersection is 0.78 for the southbound approach (see **Table 5.1**).
 - Traffic signals are not warranted at the intersection at the projected 2023 total traffic levels (see **Table 5.2**).
- 5.3 The proposed development has minimal impact on the Kelly Lake Road /Southview Drive intersection and will not bring about the need for any mitigation measures at the intersection.

Derivation of 2017 Base Year Traffic Volumes

At the time of the Naomi Park Traffic Study, Lorne Street was being reconstructed with four lanes reduced to two lanes (one in each direction). Traffic patterns in the area were altered significantly by the reduced capacity along Lorne Street and the restrictions on some turning movements in the section under reconstruction. Traffic volumes along Kelly Lake Road and Southview Drive experienced noticeable increases in traffic because of Lorne Street.

The City did not have any recent counts at the Southview Drive/Kelly Lake Road intersection from before the start of the reconstruction along Lorne Street. The City, however, did have a number of current counts in the general area adjacent to the intersection. In discussions with City staff, it was agreed that counts by Tranplan (conducted during the Lorne Street reconstruction) could be adjusted using the nearby City counts to produce 2017 base year traffic volumes at the intersection for study purposes.

Exhibit A attached shows the May 11, 2017 intersection count by Tranplan and the nearby City tube counts plus an intersection count at Kelly Lake Road/Copper Street. The Tranplan PM peak hour counts are approximately 50% higher then the nearby City automatic recorder (tube) count, but individual volumes range from 33% to 76% higher.

The Tranplan count volumes were adjusted to produce the turning movement volumes shown in Exhibit 3.1a in the main body of the report. It is recognized that the 2017 base year traffic volumes are only "best guess" estimates, but they are considered valid for determining how much difference the proposed development will make at the Southview/Kelly Lake Road intersection.
